

Information Maps: Supporting Students Through Their Research and Writing Processes

Authors

By Associate Professor Lisa Emerson, Dr Sharon Stevens, and Dr John Muirhead, School of English and Media Studies, Massey University.

Imaps provide a visual description of the sources students have engaged with over the research stages of a project. An imap typically includes information about the sources themselves, where they were found, and how they relate to the topic of interest. This publication describes how imaps have been integrated into a first year science class as a way of enhancing information literacy, reducing plagiarism and facilitating feedback on students' research and writing processes. Recommendations for using imaps to promote student research and writing are provided.

Introduction

One of the biggest learning hurdles for students when writing assignments is understanding how to work with other texts. At one level, this is a simple matter of information literacy: students are unsure of what constitutes a quality or appropriate source for a specific context. But at a more complex level, once students have found their sources, they are unsure how to use them. Common questions they ask include:

- Do you want me to just say what everyone else says – or do you want to know what I think?
- What should I do if I disagree with an author?
- How do I balance what I think with what other authors say?
- How much should I quote? What if I can't think of another way of saying something?
- What if I plagiarise by accident?
- What do I do if I just know something and can't reference it?

It may be that the only advice students are given about negotiating the use of secondary sources are dire warning against the perils of plagiarism or instruction on the mechanics of APA conventions – neither of which are effective ways of supporting students as they grapple with these complex questions (Howard, 1999; Lillis, 2001; Gaipa, 2004; Park, 2003).

Our interest in finding ways of helping students develop information literacy and the skills to negotiate relationships between their own ideas and secondary texts emerged out of our work with first year students. Also:

- plagiarism had emerged as a problem in one of our classes, and subsequent investigation showed that most students did not have a full understanding of the complexities of the issue (see Emerson, et al, 2005).
- We had concerns with the quality of our students' research strategies and with their understanding of the writing process for a complex document such as an academic essay or research report.
- We were concerned that standard approaches to teaching the writing process were too wordy for our more visually and kinaesthetically orientated science students.

Background

We first encountered the information mapping concept (the imap) at a conference¹ on plagiarism where Walden and Peacock (2008) introduced it as a tool they had developed to combat plagiarism and develop research skills amongst graphic design students. We saw that the imap could have far more wide-reaching benefits. In particular, we developed the following ideas:

- that the imap could be adapted in a range of ways for teaching students both appropriate methods of interacting with secondary sources and appropriate writing processes;
- that the imap could be an invaluable tool for facilitating teacher feedback on students' research and writing processes; and
- that it would be a particularly effective way of teaching writing processes to visual or kinesthetic learners.

We therefore decided to adapt the imap for three courses we were teaching, and to evaluate (through a range of data collection methods such as reflective journals, questionnaires, student and tutor interviews) the effectiveness of the imap for the purposes outlined above. This paper focuses on the use of the imap in one of these courses - a first year science writing course – and shows how imaps could be used in other courses.

What is an imap and what are its key features/benefits?

An imap, as conceived by Walden and Peacock (2008), is described thus:

The imap is a way of recording the research stages of a project, focusing on the information-handling process. ...An imap logs such things as finding sources, reading and evaluating them, taking ownership of ideas, formulating a response or argument, evaluating sources where appropriate, and building a bibliography, in a visual account of the process (Walden and Peacock, 2008, p. 142).

It can include any graphical representation of the research process, including annotated bibliographies, journals, interview sources, mindmaps, flow diagrams, images, key words etc. The key issue is to represent the pre-writing and writing process, through a combination of graphical and written material (Walden and Peacock. 2008).

¹ 1 - *Originality, imitation, plagiarism: A cross-disciplinary conference on writing, University of Michigan, Sept 23-25.*

An imap corresponds with other forms of pre-writing (eg research logs) and is expected to have similar benefits for students. However, two things were significantly different about the imap, as we designed it, compared with other kinds of pre-writing activities

- a. its substantially graphical nature
- b. the integration of writing process activities with source-interaction approaches.

The imap can take a range of forms and be used for either formative or summative assessment. In this class, we used the imap for both formative and summative purposes, and evaluated the process over three semesters.

How the imap was integrated into a first year science class

Communication in the Sciences (119.155) is a compulsory course for most students enrolled in a science degree at Massey University (approximately 700 students annually). The course assessment includes two written assignments: an essay and a group report. The imap was incorporated into both written assignments, and was used both for the formative assessment (during a tutor clinic – a meeting between a student or student group and a tutor), and marked (20% of the assignment grade) as part of the summative assessment.

The imap for this course was presented similarly to the imap developed by Walden and Peacock, but with the addition of incorporating material where students visually represented their interaction with secondary sources. For the individual essay, students were asked to develop an A4-A3 sized visual representation of their research and writing process, and their interaction with their texts; for the group report, the student groups were asked to develop a poster sized imap which represented both their individual and group process.

Our aims for the imap for our students were two-fold:

1. We wanted our students to understand the research and writing process
2. We wanted them to engage fully and appropriately with secondary source material (for example, critiquing texts and considering how their own ideas related to those of other sources).

We therefore scaffolded the imap writing process in a number of ways. Firstly, we modelled the writing process in class – and in this way students were helped to build up the imap over time. For example, in week 2 of the course, students completed a brainstorm on their topic and listed potential key words. In week 3, they wrote out a detailed account of their research strategy and outcomes. In week 4, they wrote annotated bibliographies and new ideas from their reading. All this material was then transferred to their imap in visual form.

Second, we asked students to engage with texts in active ways. For example, as mentioned above, we asked students to write short annotated bibliographies in class and share their ideas with others. We asked them to write annotations on an article itself to model the idea of interacting with a text. In one of the other classes that used imaps, the course coordinator asked students to draw pictures which indicated their own relationship with a text (eg were they holding hands with the source, at war with them, or leapfrogging over them?), as suggested by Gaipa (2004). In this way, we hoped to help students see how reading was an active process which involved critical and personal engagement.

The following pictures (pages 4-6) are examples of how students have indicated their relationship with their texts –

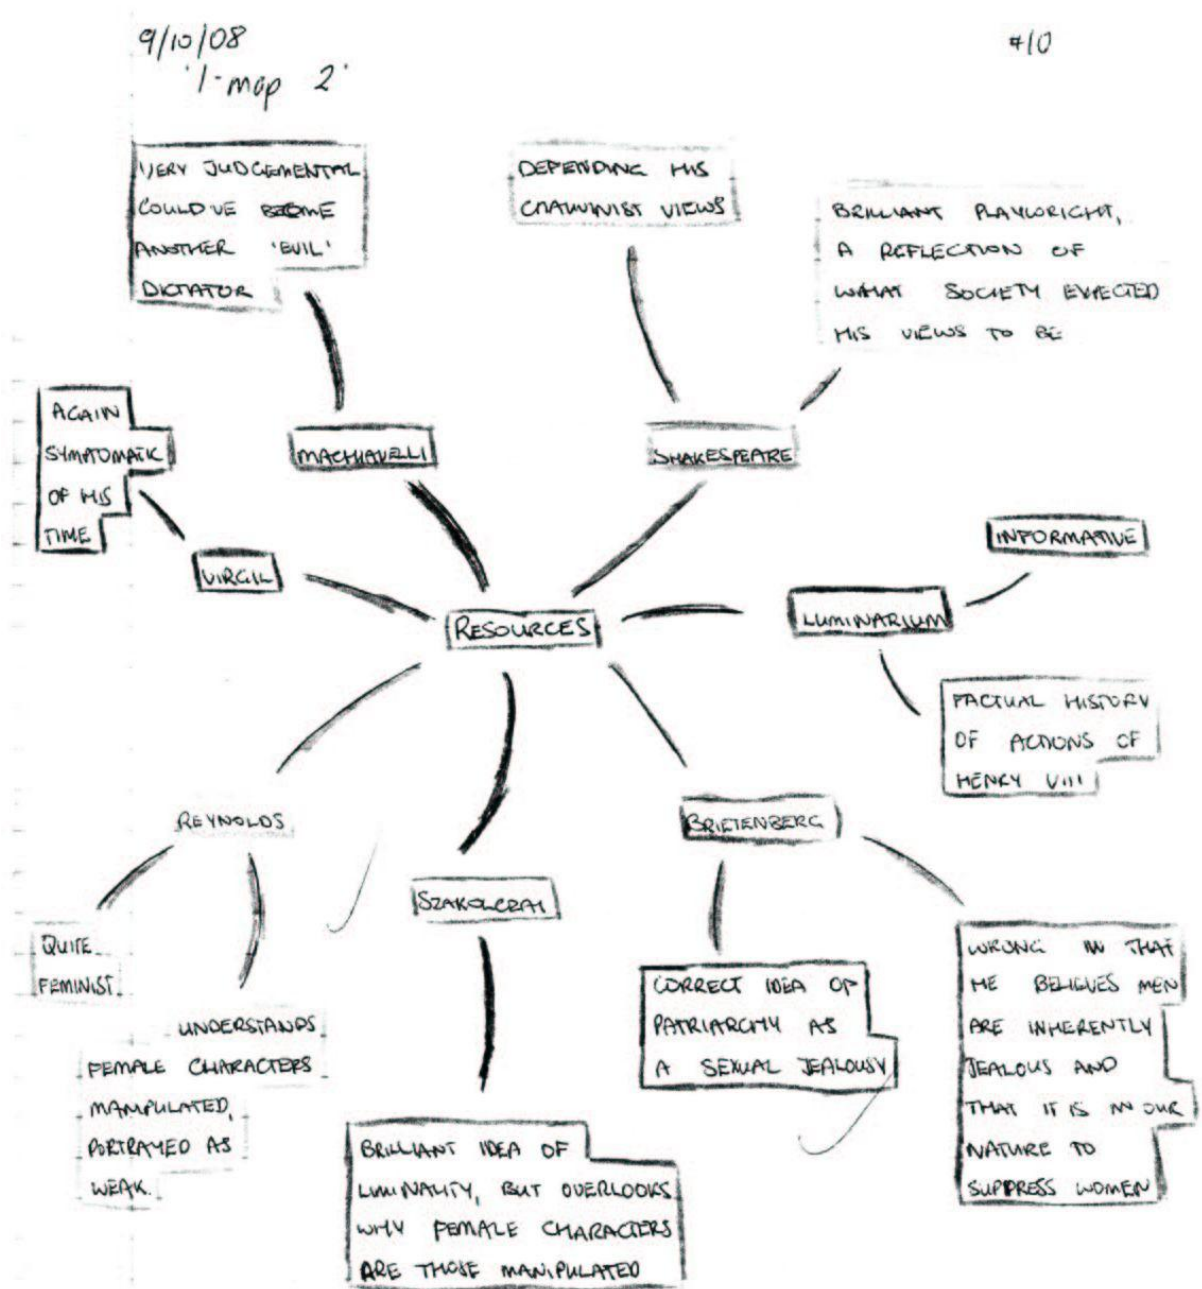

Aipad Szakolczai vs Paige Reynolds

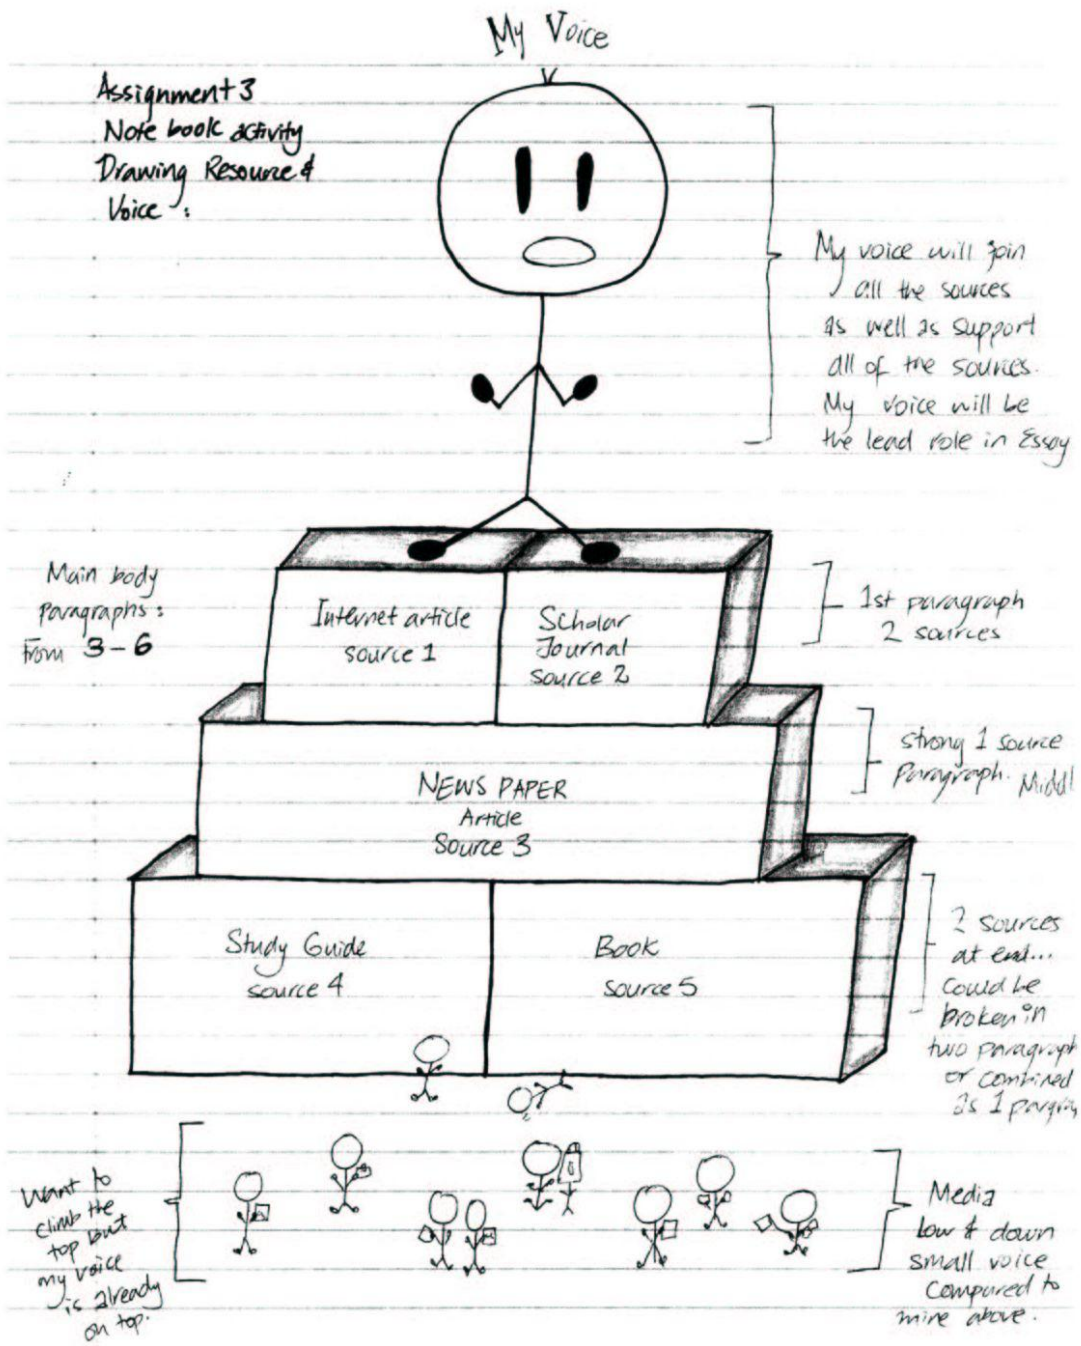

Cherjevi Move

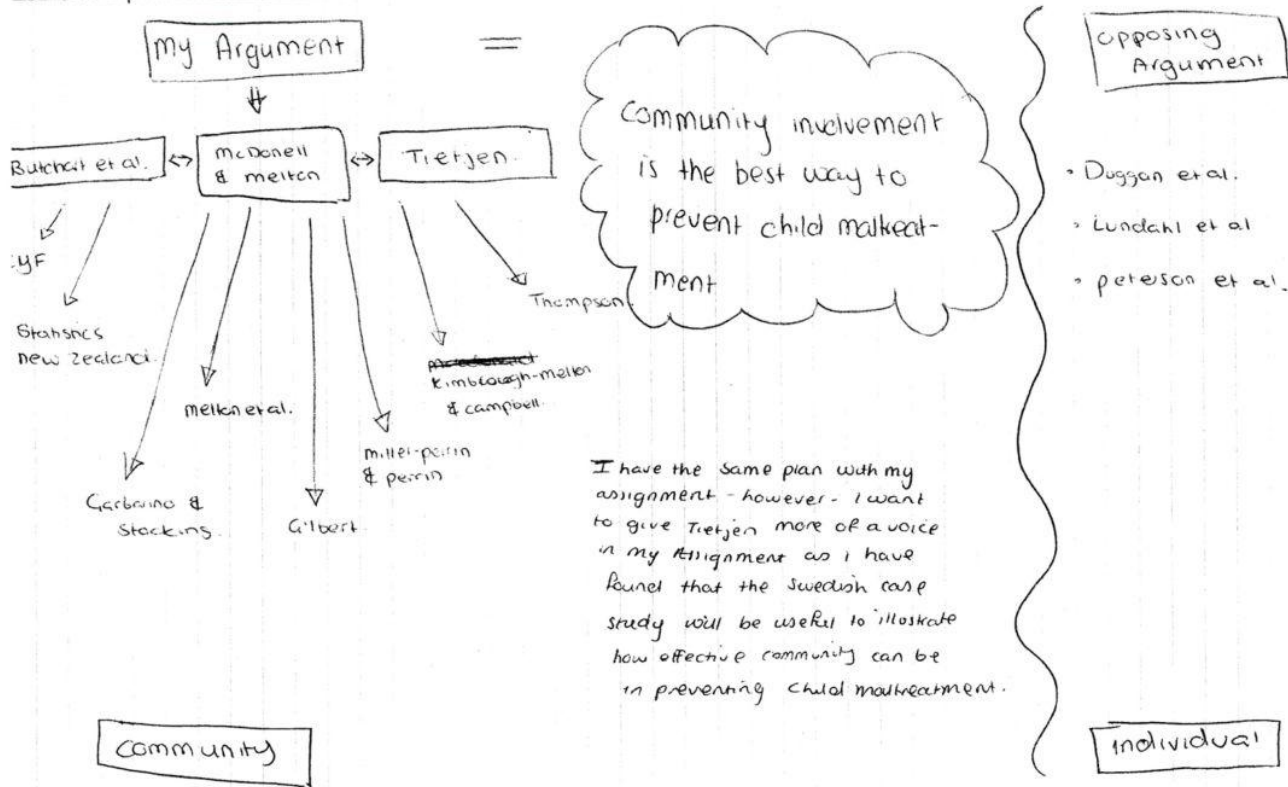

From here, students were asked to draw mindmaps which showed their engagement with sources in relation to the structure and theme of their assignment (pages 7-9).

2nd drawing.

Could the prevention of child maltreatment be an individual or a community responsibility

Third, at our students' request, we provided a handout on what must be included in the imap; however, we encouraged students to add other items into their imap if they were relevant to their process, and to be visually creative. Students also asked for models of imaps, so they could understand the concept more easily, so we collected copies of great imaps, and displayed these in a meeting space where students could view them freely.

We did initially fear that providing too much direction and models would lead to a standardised, idealised product, but these fears were completely unfounded. On the contrary, the combination of engaging in in-class scaffolding and exercises, and providing models and directions seemed to free up students to engage creatively with the material, both in what they included in the imap and how they portrayed the visual process. No two imaps are ever the same – and we were confirmed in our view that taking a visual approach to teaching process has been enormously helpful in enabling our visual and kinesthetic learners to understand the writing process. Students generally take great pride in the visual representation of the imap. Furthermore, our students' assignments show evidence of students being more confident about engaging with secondary source material, articulating their own position in relation to a research question, and understanding the writing process.

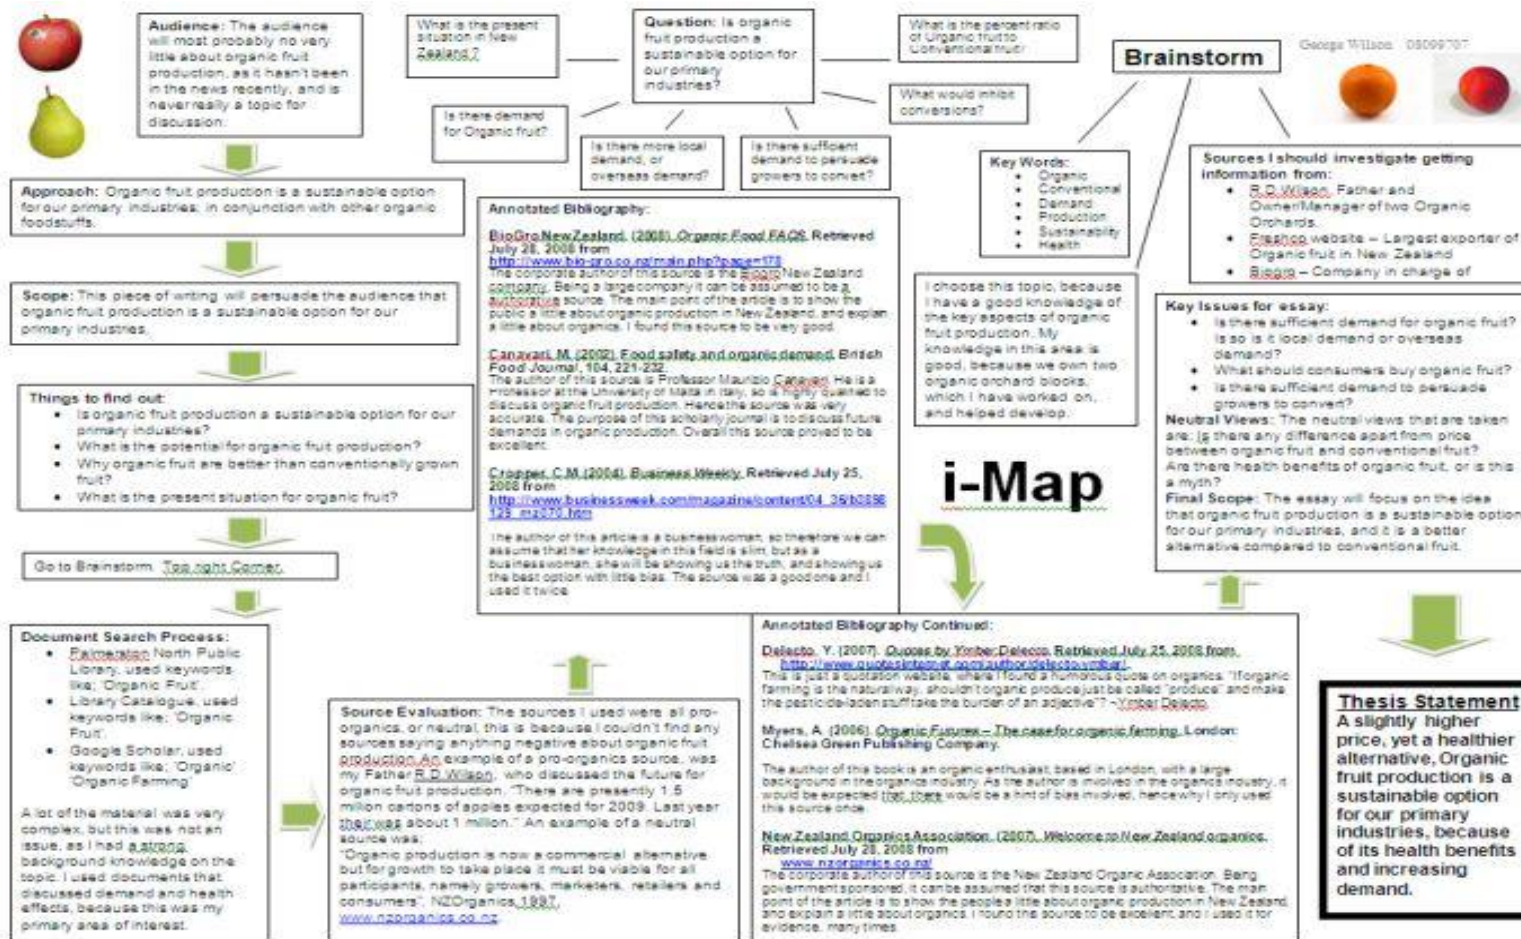

The imap has also been very useful for tutors as part of the formative aspect of the assignment. One of the course tutors commented recently "I used to have to read a whole essay before I could confirm if a student had based their essay on three sources from a google search. Now, I can simply glance at the imap and see in a moment that this is the case, and can address the issue directly. And students know this is the case and so they simply don't try to take the short cuts". Another commented "The imap, more than anything else, has taught students the value of a careful information gathering and writing process. It models the process for them, and so teaches them how to engage and, more importantly, interact with sources"

Benefits of imaps

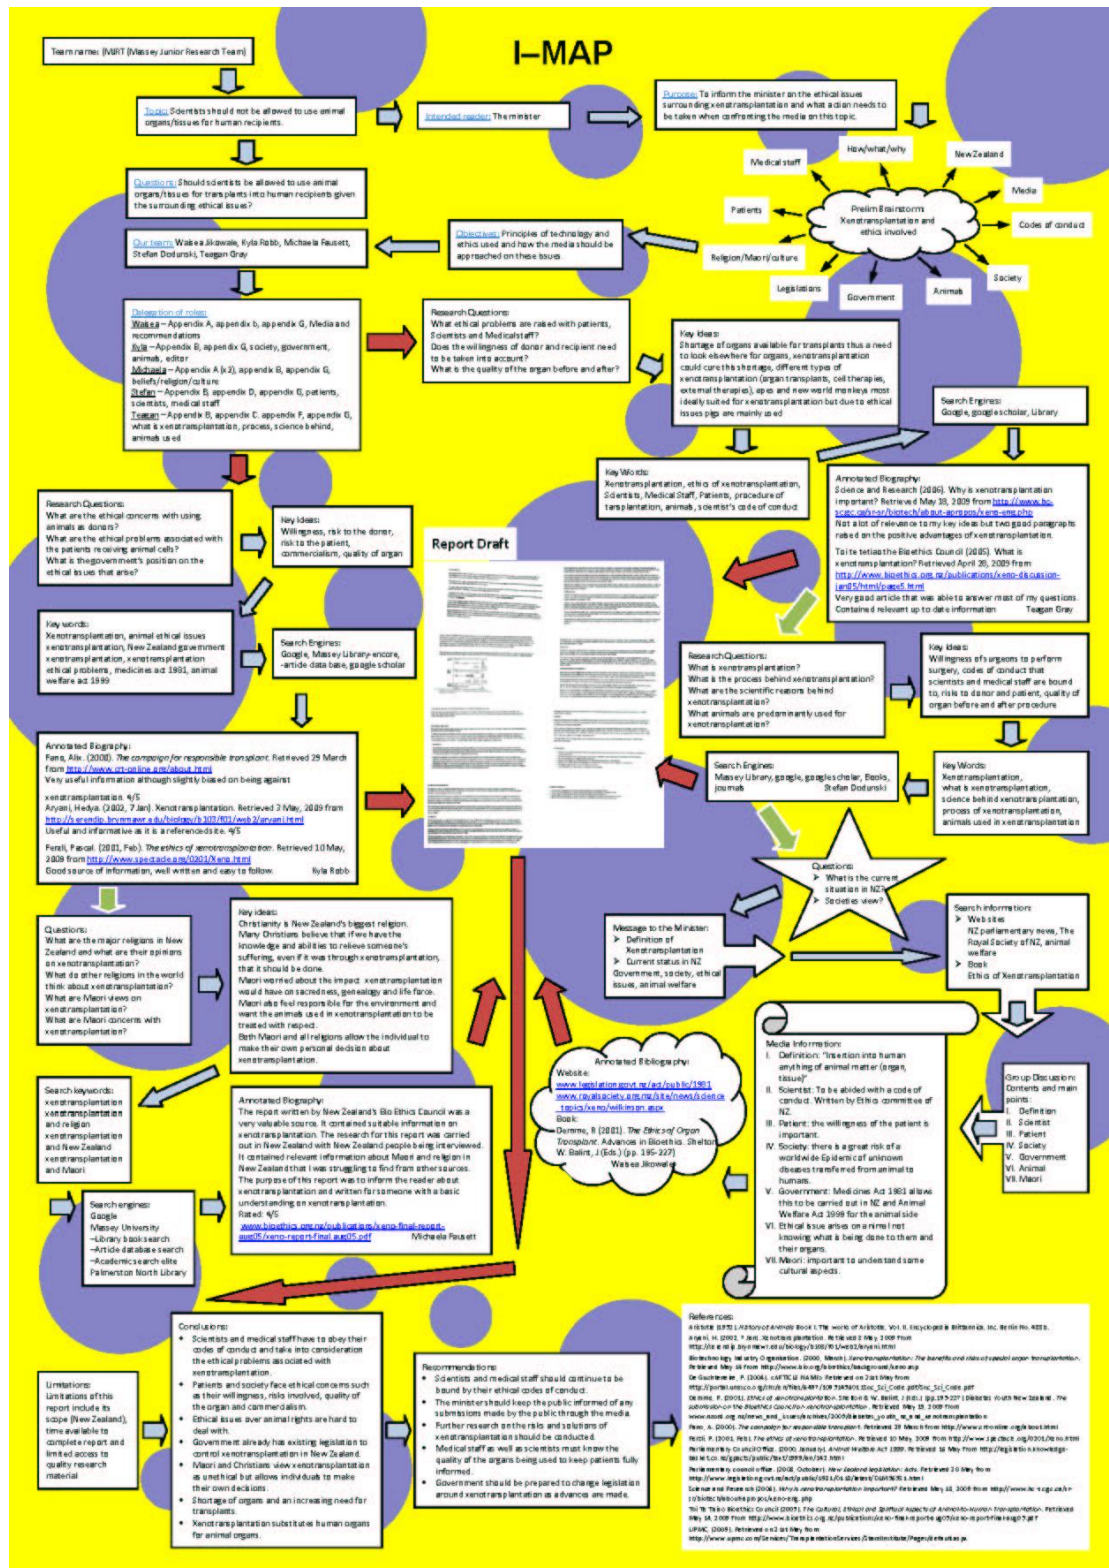

Our research showed that students benefited from the use of the imap in a number of ways. These are the key benefits of imaps:

- They help students articulate the value of a research source
- They help students to establish their relationship with a research source
- They help students to follow an appropriate search strategy
- They support students through the writing process, and enable them to articulate an effective writing process.
- They provide invaluable information to tutors at a formative stage, allowing them to instantly assess a student's research strategy and provide formative feedback to students.
- They are useful in group projects at the formative stage as discussion points for groups in relation to process and secondary source material
- They are useful to markers of group projects, to show how different group members engaged with secondary source material.
- The visual aspect of the imap was perhaps one of the greatest benefits to students. A majority engaged creatively with the visual aspect and showed pride in the quality of their work.

Examples of maps from Assignment 3, displayed across pages 13-15 (group report) –

XENOTRANSPLANTATION

Report Topic: Scientists should not be allowed to use animal organs/tissues for human recipients.

BRAINSTORMING-PRE-REPORT:

- Team objectives:**
- To make new friends
 - To work well together for the report
 - To individually work when it is possible to not let other team members down
 - To complete the assignment to the best of everybody's abilities
 - To not be judgemental of other team members work - to give constructive criticism
 - To keep the main goal in mind, of informing the minister of the science involved in xenotransplantation
 - To give a detailed insight into ethical issues related to the science and processes involved in xenotransplantation
- Team objectives:**
- Catherine - Ethics, conclusion
 - David - Introduction with up, ethics and cover letter
 - Jonathan - Ethics and conclusion
 - Michelle - Introduction with up, ethics and cover letter
 - Philippe - Ethics, conclusion
 - Rochele - Introduction with up, ethics and cover letter
 - Team website
 - Individual evaluations

- Meeting:**
- Introduction:** Introductory meeting Wednesday 9th of April at 2:30pm. Duration of meeting: 45 minutes. We chose a topic. Scientists should not be allowed to use animal organs/tissues for human recipients.
 - Planning:** On the 17th of May at 10pm. Duration of meeting: 45 minutes. In this meeting, we decided on many words to use in each section, picked language that we would use in our report and decided on our team allocation.
 - Writing:** Wednesday 9th of May at 1:15pm. Duration of meeting: 45 minutes. In this meeting, we decided on many words to use in each section, picked language that we would use in our report and decided on our team allocation.
 - Editing:** Monday 11th of May at 5:30pm. This was only a meeting to hand over the work we had done to the Catherine so she could start putting things together. (Duration: 45 minutes on topic discussion)
 - Final proof:** Wednesday 17th of May at 1:15pm. Duration of meeting: 45 minutes. In this meeting, we checked information from everybody for the report and Catherine documented editing methods.
 - Final proof:** Wednesday 20th of May at 1:15pm. Duration of meeting: 45 minutes. Decisions made include: People needed at 11pm information to Philippe 24/05/09. Had to make new plan for interview, Rochele took over the introduction and cover letter, over the ethics, and we were able to write what had been the team roles were.
 - Final proof:** Friday 22nd of May at 1:15pm. Duration of meeting: 45 minutes. The purpose of this meeting was to see where everybody was up to and to make sure everybody was up to date with all his/her deadlines.
 - Final proof:** Wednesday 27th of May at 1:15pm. Duration of meeting: 45 minutes. In this meeting, we checked what everybody needed to complete for the report, and when our final "team" due date was.

INDIVIDUALS WORK:

ROCHELLE:

What is Xenotransplantation by Rochele Douglas:

- Xenotransplantation: what it is - transfer of animal cells, tissues or organs into a human
- Overview of the Science: Why organ got rejected
- A donor and recipient which makes the two species are not closely related such as human and pig, have a hyper acute response to the donor organ. In this case the hyper acute response is often fatal within hours. Closest related recipients which are specific to humans are closely related normally take a few days before there is a sign of organ rejection.
- Some discovered and current ways of preventing organ rejection
- Scientists are now working on a way to create hyper acute response which antibodies reject. They were successfully able to create a pig gene which prevents chances of their organ to be rejected by humans.

Search methods by Rochele Douglas:

- On the 27th of May, I did a Google search, the keywords used were: xenotransplantation, Science of xenotransplantation and animal organ transplants. From these I found three articles and one diagram for which I studied what was the best article. The only article that was useful for my report was:
 - <http://journals.sagepub.com/journalInfo/42020-overview>
- On the 27th of May, I did a library search, using the keywords: Xenotransplantation, biotechnology, ethical issues and using biology. From the search I found two useful books, the ones were:
 - Biotechnology for beginners, edited by Annette L. Owen
 - Introduction to biotechnology 2nd edition, by William J. Trevors & Michael, Parkson

KARYN:

Pro and Cons by Karyn Paton:

Positives:

- Xenotransplantation offers a solution to the world's critical care organ shortage.
- Animal organ donation would mean that people suffering from disease such as diabetes and neurodegenerative disorders could receive a transplant much sooner.

Negatives:

- Rejection of the donor organ by the immune system. Rejection occurs when the recipient's immune system rejects the foreign tissue of organ and attempts to destroy it.
- There is a serious concern that xenotransplantation may transfer diseases into the organ recipient.

Search methods by Karyn Paton:

- On the 17th of May I went to the Turku campus library and searched for 'xenotransplantation' in the morning until 10:00. The books that I found were not very useful. I then decided to search the Turku digital library. I found some interesting books on the ethics of biology in general but nothing directly related to xenotransplantation.
- On the 22nd of May I used the internet Google search. There were 400 hits in total for my search.
- Most of the articles were related to other animal hosts, and not to the specific issue of xenotransplantation. I found a few articles that were useful for my report in the discussion which was 'pro and cons'.

JONATHAN:

Ethics by Jonathan Gupwell:

- Currently the medical society is very interested in looking after patients welfare. Xenotransplantation has to be looked at. To help improve this risk some monitoring systems have been put in place. Xenotransplantation is a controversial issue because of the risk of disease transmission and the ethical issues surrounding the use of animals for human benefit.
- Allocation of organs in xenotransplantation is a controversial issue because of the risk of disease transmission and the ethical issues surrounding the use of animals for human benefit.
- Individual risks in this about risks to do with xenotransplantation. People believe that the risks should not be done at the moment. Issues have been raised about how suitable if patients could give their consent to a procedure like this.

Search methods by Jonathan Gupwell:

- Firstly I went to Turku campus library and searched for 'xenotransplantation' in the morning until 10:00. The books that I found were not very useful. I then decided to search the Turku digital library. I found some interesting books on the ethics of biology in general but nothing directly related to xenotransplantation.
- On the 22nd of May I used the internet Google search. There were 400 hits in total for my search.
- Most of the articles were related to other animal hosts, and not to the specific issue of xenotransplantation. I found a few articles that were useful for my report in the discussion which was 'pro and cons'.

Ethics by David Brown:

- Animal ethics. This is an animal welfare, and whether or not the animal should suffer or be sacrificed for the sake of humans.
- Cultural and religious ethics. This is about the ethics of different cultures and religions. Some religions are more compassionate than others, but it is not always clear what the right thing to do is.
- Cost of money. This is about the cost of the procedure. It is a very expensive procedure, and it is not always clear whether it is worth the cost.
- Knowledge and knowledge. This is about the knowledge of the procedure. It is a very complex procedure, and it is not always clear whether it is worth the risk.

Search methods by David Brown:

- On the 30th of April I went to the Turku campus and used the library search engine. I came across a few promising titles, although many seemed to be out of my field of the books remaining, only a few more to do a small search on xenotransplantation.
- On the 13th of May I did an internet search on academic sites using the keyword xenotransplantation. I found some articles which I then used for my report.
- Some of the articles I found were about the ethics of xenotransplantation, and some were about the science of xenotransplantation. I found a few articles that were useful for my report in the discussion which was 'pro and cons'.

Recommendations for using imaps to promote your students' research and writing process

Imaps could be included in any course that is concerned about the quality of students' research strategies, and where students need to learn how to interact with other sources. If you would like to use imaps as part of your assessment strategy, we recommend the following:

- You need to take a broad, creative approach to what an imap might look like, so that students are allowed maximum creativity in the process. It is beneficial to provide a wide range of models to students, to assure them that a wide range of approaches are appropriate.
- You need to provide a list of items that should be included in the imap, with emphasis on the idea that other items may be included.
- It is important to emphasise to students that you would like them to present a real (as opposed to idealised) representation of their process.
- Ideally imaps should be used initially as part of the formative assessment process. This allows students to then correct any errors in their information search strategy.
- They can also be used successfully as part of summative assessment, if you wish to reward effective process as well as effective product.
